SUMMARY

DevOps Engineer and cloud practitioner who transitioned from systems support into automation and infrastructure engineering. Hands-on experience designing CI/CD pipelines, automating provisioning with Terraform Ansible, containerizing applications with Docker and Kubernetes, and deploying workloads on AWS. Focused on measurable improvements: deployment speed, reliability, and observability.

CORE COMPETENCIES & TOOLS

Version Control	Git, GitHub
CI / Build	Jenkins, Maven, GitHub Actions
Containers / Orchestration	Docker, Kubernetes, Helm
Infra Automation	Terraform, Ansible
Cloud	AWS: EC2, S3, VPC, IAM, CloudWatch, SNS, CloudFormation, Elastic Beanstalk, Route53, Lambda
Monitoring & Logging	Prometheus, Grafana, Splunk, CloudWatch
Scripting	Python, Bash / Shell
OS	Linux (RedHat, Ubuntu, Amazon Linux), Windows
Other	SonarQube, JFrog Artifactory, Nginx, Tomcat, ServiceNow, Chrome Dev tools

EXPERIENCE

Associate Engineer - Systems Operations (with DevOps Transition Work)
PFS Commerce / GXO Logistics, Bangalore, India

Aug 2024 – Dec 2025

- Managed identity and access for 500+ users using **Microsoft Entra (Azure AD)** and **Active Directory**; automated user audits and reporting with Python Shell.
- Supported internal cloud-hosted applications, Exchange, VPN, and system access workflows across multiple teams.
- Built internal automation scripts for provisioning, health checks, logging, and repetitive operational tasks-reducing manual effort and speeding up resolution cycles.
- Used **CloudWatch, Splunk, and SNS** for monitoring, alerting, and incident communication; improved detection of recurring issues through proactive thresholds.
- Contributed to internal infra tasks such as IAM cleanup, cost tagging, access policy reviews, EC2/S3 basics, and CloudWatch dashboard enhancements.
- Created documentation, runbooks, process notes, and escalation workflows that improved operational consistency across teams.

Technical Support Engineer
PFS Commerce, Bangalore, India

Aug 2022 – Aug 2023

- Provided L1/L2 support for cloud applications, Exchange, AWS Connect, SSO MFA, and endpoint issues for 500+ internal users.
- Troubleshoot system, application, and network issues; handled ticket triage, RCA documentation, and cross-team escalations.
- Automated routine tasks using Python/Shell scripts (report generation, system checks, onboarding/offboarding utilities).
- Configured alerting workflows using **CloudWatch** and **SNS**, improving visibility and response time for operational incidents.

DETAILED PROJECTS & RESULTS

1) AWS Infrastructure Automation (IaC Project)

Portfolio / Hands-on

- Built a fully reproducible AWS environment using **Terraform**: VPC, public/private subnets, route tables, IGW/NAT, security groups, and EC2 instances.
- Automated OS configuration, application deployment, and package installation using **Ansible** playbooks.
- Implemented monitoring and alerts using **CloudWatch metrics + SNS**, and added performance dashboards in **Grafana**.
- Created documentation and runbooks for infra deployment, teardown, and troubleshooting.

- **Outcome:** Complete infra + app deployment executed end-to-end in **15 minutes** for test environments.

2) CI/CD Pipeline Implementation (Jenkins + GitHub)

- Designed a multi-stage CI/CD pipeline using **Jenkins**, integrating GitHub, Maven, SonarQube, Docker build and push stages.
- Automated deployment to AWS EC2/Nginx test environments using scripted pipelines.
- Added smoke tests and simple health checks to detect failed deployments and trigger rollbacks.
- **Outcome:** Deployment steps became fully automated and repeatable for practice projects.

3) Kubernetes Deployment & Helm Packaging

- Containerized applications using **Docker** and deployed them to a Kubernetes test cluster.
- Wrote Kubernetes manifests (Deployments, Services, Ingress, ConfigMaps) and converted them into reusable **Helm charts**.
- Validated rolling updates, readiness liveness probes, and horizontal pod autoscaling.
- Experimented with canary and blue green deployment patterns in a controlled environment.

4) Monitoring, Logging & Cost Optimization (AWS + Prometheus + Grafana)

- Set up end-to-end observability using **Prometheus + Grafana** to monitor container performance and cluster metrics.
- Integrated **CloudWatch log groups, alarms, dashboards** for AWS resources.
- Implemented tagging and performed cost checks on non-prod setups; tested basic rightsizing and scheduled stop/start automation.
- Created alert rules based on latency, CPU/memory thresholds, and error counts.

SELECTED ACHIEVEMENTS

- Built multiple end-to-end DevOps workflows (IaC + CI/CD + Docker + Kubernetes) used across my portfolio.
- Automated repetitive tasks using **Python + Shell**, improving speed and reducing manual effort in my previous role.
- Improved detection and response time for recurring issues by enhancing **CloudWatch + SNS** alerting during operations work.
- Created detailed documentation and runbooks that improved team onboarding and operational consistency.
- Demonstrated strong DevOps foundation through hands-on implementations of pipelines, Terraform modules, Kubernetes deployments, and monitoring stacks.

TOOLS & TECHNOLOGIES (compact)

Infrastructure as Code	Terraform, CloudFormation, Ansible
Containers	Docker, Kubernetes,
CI/CD	Jenkins, Maven, GitHub Actions, SonarQube, JFrog
Cloud	AWS (EC2, S3, VPC, IAM, CloudWatch, SNS, Route53, Lambda)
Monitoring	OpenTelemetry, Prometheus, Grafana, Splunk, CloudWatch
Scripting	Python, Bash / Shell
Version Control	Git, GitHub
Issue Tracking	Jira, ServiceNow

EDUCATION

Bachelor of Computer Applications (BCA) - Izee Group of Institutions, Bangalore, India
Computer Science (CS) - RV Govt School, Tamil Nadu, India

CERTIFICATIONS

- **AWS Certified Cloud Practitioner** - Amazon Web Services
- **DevOps & Cloud Computing Course** - Saidemy
- **Computer Network Fundamentals** - Udemy
- **API Fundamentals** - Udemy
- **Python (Flask Framework)** - RESTful API Development
